

## GRACIOSA ISLAND GRID

### Grid control, integration and optimisation

Heavy dependence on fossil fuel imports, coupled with a growing climate crisis, puts islands around the globe in a very unique bind as it relates to energy security. Relying on oil, diesel and natural gas shipments has been a very expensive endeavor and traditionally the only option for these isolated communities. That is until now. Integrating renewable energy has not only become an economically viable alternative, it's also a sustainable one.

#### **On the path to 100% renewable energy via grid control, integration and optimisation**

Graciosa, a Portuguese territory located in the northern Azores, is one of many islands pursuing a hybrid approach to island grid energy generation, combining wind, solar, energy storage and thermal generation.

Led by Graciolica Lda, the project combines solar and wind generation, together with energy storage using lithium-ion batteries supplied by Leclanché SA. This project represents the journey towards a 100% renewable energy future with an integrated power system combining renewables, engines and energy storage that will deliver both economic and environmental benefits.

#### **A solution for an islanded grid**

Supplying energy for an entire island community entails a unique skillset beyond simply connecting inverters and batteries—which is why Graciolica Lda engaged Wärtsilä. Leveraging the industry-leading GEMS energy management platform, the island grid of Graciosa addresses baseload supply requirements while accommodating fluctuations in output that are inherent to energy supplied from renewable sources, such as solar and wind.

**“Our investment helps create a renewable energy asset that will deliver both economic and environmental benefits. This project represents the future direction of the global energy sector with an integrated power system combining renewables and energy storage. We appreciate Wärtsilä’s professionalism in providing the software needed to expand the functionality of the microgrid to create overall system reliability and performance.”**

*Scott Macaw, Director,  
Graciolica Lda*

The optimisation and monitoring capabilities of the GEMS platform will maximise the performance and longevity of the Graciosa energy system. Data inputs from Supervisory Control and Data Acquisition (SCADA), electric meters, heating, ventilation and air conditioning, as well as weather forecasts are evaluated within GEMS for optimal energy distribution. The relationship does not stop at the deployment. Wärtsilä has also provided software maintenance services under a five-year agreement.

**A path to energy independence**

The Graciosa Hybrid Renewable Power Plant will enable 1.0 MW of solar, 4.5 MW of wind power and 6.0 MW / 3.2 MWh energy storage system supplied to the local grid, reducing the islands’ reliance on petroleum imports and significantly reducing greenhouse gas (GHG) emissions.

Graciosa Lda’s end client, local utility EDA, anticipated that this investment would boost renewable energy consumption from 15% to 65%; and the project has done just that, with more than 52 days running at 100% renewable energy in the first year of operation.

Not only does this reduce the island’s carbon footprint, but the hybrid island grid also reduces the cost of energy for the island and its customers going forward.

THE CHALLENGE	WÄRTSILÄ’S SOLUTION	BENEFIT
<ul style="list-style-type: none"> <li>Heavy dependence on external sources for energy fuel, including high costs of importing fossil fuels to power the island’s energy grid and relative unreliability of supplies</li> </ul>	<ul style="list-style-type: none"> <li>Hybrid storage solution integrated and GEMS optimised energy generation, combining wind, solar, energy storage and thermal generation assets</li> </ul>	<ul style="list-style-type: none"> <li>Reduced island’s reliance on imported fossil fuels and significantly cut down on greenhouse gas emissions by boosting renewable energy consumption from 15% to 65%</li> </ul>

**CUSTOMER:** Graciosa Lda  
**SITE SIZE:** 1.0 MW of solar, 4.5 MW of wind power and 6.0 MW / 3.2 MWh energy storage system  
**SITE LOCATION:** Azores, Portugal  
**APPLICATION:** Renewables integration Island Grid+  
**OPTIMISATION:** Engine and battery economic dispatch. Renewable curtailment. Engine operating constraints. Grid quality and spinning reserve requirements.
